

A Psychologist saw a Living Pterosaur, According to American Author Jonathan Whitcomb

A prehistoric-looking creature flies over an island in Papua New Guinea, according to psychologist Brian Hennessy.

For Immediate Release

LONG BEACH, Calif./EWorldWire/June 8, 2007 --- A psychologist at a university in Central China asserts that he saw, in 1971, a prehistoric-looking creature flying in Papua New Guinea. Brian Hennessy of the Chongqing University of Medical Sciences described the creature as black or dark brown with a "longish narrow tail" and a beak that was "indistinguishable from the head."

In the daylight of an early morning on Bougainville Island, on a dirt road that led down to the coast, Hennessy heard a slow "flapping" and looked up to see a "very big" creature with a "horn" at the back of its head. There was "not a feather in sight."

After thirty-five years, in the summer of 2006, a friend of Hennessy referred him to the American, Jonathan Whitcomb, author of the book "Searching for Ropens," who interviewed him. The eyewitness account was added to the second edition of the book, which was published on May 30, 2007.

Until 2006, Hennessy had been unaware of cryptozoological expeditions related to what he had seen. (Whitcomb's book tells how, in the 1990's, a few Americans began investigating, in Papua New Guinea, creatures described like living pterosaurs, commonly called, by Americans, "pterodactyls.") Hennessy was also unaware that many natives have names for giant flying creatures: One of those names is "ropen."

The American author noticed similarities between Hennessy's description and that of a creature reported 500 miles to the west, near Finschhafen, Papua New Guinea, twenty-seven years earlier. In 1944, Duane Hodgkinson, now living in Montana, saw a giant "prehistoric" creature flying over a clearing where he and another soldier were standing.

Whitcomb had interviewed Hodgkinson in 2004 and realized, two years later, that both the American veteran and the psychologist had seen a dark flying creature with a long tail but no sign of feathers. Both men used the word "prehistoric."

In 2006, Whitcomb showed Hennessy a series of sketches for determining the shape of the head, including the beak and the head appendage. (A similar questionnaire had been given to Hodgkinson two years earlier.) Whitcomb then drew a sketch based on Hennessy's answers, and concluded that Hennessy had seen, in 1971, the same type of creature that Hodgkinson had seen in 1944.

Whitcomb's book asserts that Rhamphorhynchoid pterosaurs live in Papua New Guinea and that they are larger than Rhamphorhynchoid fossils. Hodgkinson is specific about the size of the creature he saw: similar to that of a "Piper Tri-Pacer airplane" (twenty-nine-foot wingspan).

The book also explains the relationship between scientific and religious axioms and how they relate to the concept of living pterosaurs. Learn more online at '<http://www.ropens.com/hennessy>'
